PACKET 1 • SOFTWARE DEVELOPMENT

3 Stop Asking AI to Do Everything at Once

RefView Window/Level Display Transform

Working mode Before changing the implementation again, decompose the problem.

Work with AI to identify

- Assumptions your current solution makes
- Information that is still ambiguous
- Boundary conditions
- Invalid-input behavior
- Numerical or rounding decisions
- Tests needed to distinguish competing interpretations

Prompt to use or adapt

```
What information would you want clarified before finalizing this component?
Separate essential questions from optional design choices.
```

Team output

- Create a short, prioritized list of questions.
- Ask the facilitator for clarification when you identify information you genuinely need.
- Record each clarification and the decision or test it affects.
- Refine the interface, implementation, and tests only after resolving the highest-impact unknowns.

Reminder The problem and acceptance criteria have not changed. The goal is to improve how you discover and resolve missing information.

PACKET 2 • RESEARCH SCIENTISTS

3 Stop Asking AI to Do Everything at Once

RefView SmoothCT Experimental Evaluation

Working mode Decompose the scientific question instead of asking AI for the entire plan at once.

Investigate separately

1. What exactly must be measured?
2. What constitutes the control?
3. What variables must be held constant?
4. Which observations are actually independent?
5. How much replication is needed?
6. What sources of uncertainty exist?
7. What could falsely make SmoothCT appear successful?
8. What evidence would falsify the hypothesis?

Prompt to use or adapt

```
What information is still missing before we can finalize a scientifically credible experiment?
Prioritize questions that could change the validity of the conclusion.
```

Team output

- Create a short, prioritized list of missing information.
- Ask the facilitator for clarification when you identify a genuine need.
- Record how each answer changes the design, analysis, or decision rule.
- Refine the experimental plan.

Reminder The goal is not a longer prompt. It is a better investigation of what the experiment must establish.

PACKET 3 • PRODUCT DEVELOPMENT

3 Stop Asking AI to Do Everything at Once

RefView Auto-Window Capability

Working mode Decompose the capability before refining the solution again.

Investigate separately

1. Intended behavior
2. Algorithm inputs and outputs
3. Performance
4. Determinism
5. Fallback behavior
6. User override
7. Abnormal inputs
8. Technical risks
9. Verification evidence

Prompt to use or adapt

```
What information is still missing before these requirements can be objectively implemented and verified?
Prioritize questions that affect safety, determinism, fallback, or pass/fail criteria.
```

Team output

- Create a short, prioritized list of missing information.
- Ask the facilitator for clarification when you identify a genuine need.
- Record which requirement, risk, or verification case each answer affects.
- Refine the requirements, risk register, and verification plan.

Reminder The goal is to expose hidden decisions before they are silently embedded in requirements or tests.
